

Low Clouds

The low clouds can have an height from the surface up to 2km.

The low clouds names are:

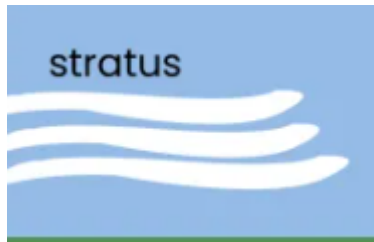

- Stratus
- Stratocumulus
- Cumulus
- Nimbostratus

Stratus

Stratocumulus clouds are very low clouds, and because they are very low, we can be in it.

They are also very thin and light, so rain can easily go through it.

They have a light grey color, and it rains when they are present.

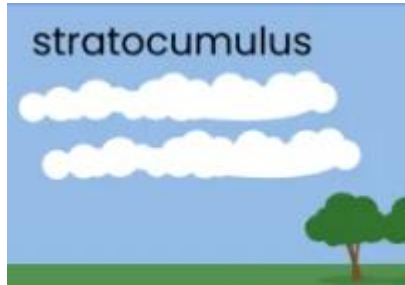

Stratocumulus

Stratocumulus clouds are very low clouds.

They are also more compact than stratus clouds, so rain cannot easily go through them.

They have a light grey color.

Cumulus

Cumulus clouds are big cotton balls.

They grow in vertical and are very light color, almost white.

They are about 1km wide.

Nimbostratus

Nimbostratus clouds are dark grey color.

They bring with them continuous rain.

They are the rainy days cloud that we can see during winter.
